

Identification Document with Printing That Creates Moving and Three Dimensional Image Effects With Pulsed Illumination

Abstract of the Disclosure

5 Identification documents have a three dimensional or moving image effect to enable human verification of their authenticity. These effects are created by printing image layers of invisible inks, such as UV or IR fluorescing inks, each depicting an object in varying position or perspective in an area on the document. When the area is strobed sequentially in different bands corresponding to the different layers, the layers
10 become visible sequentially or simultaneously, creating a moving and/or three dimensional effect.
